Selected state: active area

The active area around the select box in the default state is kept tight around the select box. Users must directly click on the select box to trigger the Selected state. Other elements sharing the same container in the item can be interacted with, e.g. an 'Open link' button in a card or a text link within a table row.

When the user selects an item from the linked list, the active area expands to cover a larger

area, making it quicker and easier to select and deselect individual items. Users can click on anywhere within the expanded active area to select/deselect that item. Other elements sharing the same container in the item can no longer interacted with until the Selected state returns to default and the active area on each of the list items shrinks to their default size.

out - depending on need - making the Action bar adjustable. Some examples of potential use are displayed below. Action bars can be used inline next to other content or also full width taking up the entire space.

Add to admin panel

On mobile devices, the action bar collapses to save screen space, condensed into a few

mobile table rows or list elements, it becomes sticky and follows the user down the page to

key buttons or icons or with an overflow menu with listed actions. To accommodate the

Overflow menus are user interface elements that provide a space-efficient way to present

additional actions and options that do not fit within the primary interface. Actions within an overflow menu are organised hierarchically or based on categories to enhance user

comprehension.

Action bars can be used inline next to other content, added to the top of existing

components or also at the top of a page and linked to a range of content below it.

There are two containers in the Action bar, the container to the right (ActionBar.List) has

special qualities - see section on Overflow. The ActionBar.List has an alignment to the right.

When elements are added to, removed or put into an overflow menu, all the elements within

When an action bar is used with a table we can add a column filter. The column filter allows the user to customise

what columns they show or hide in the table. There should be an option to save this filter so if the user leaves the
