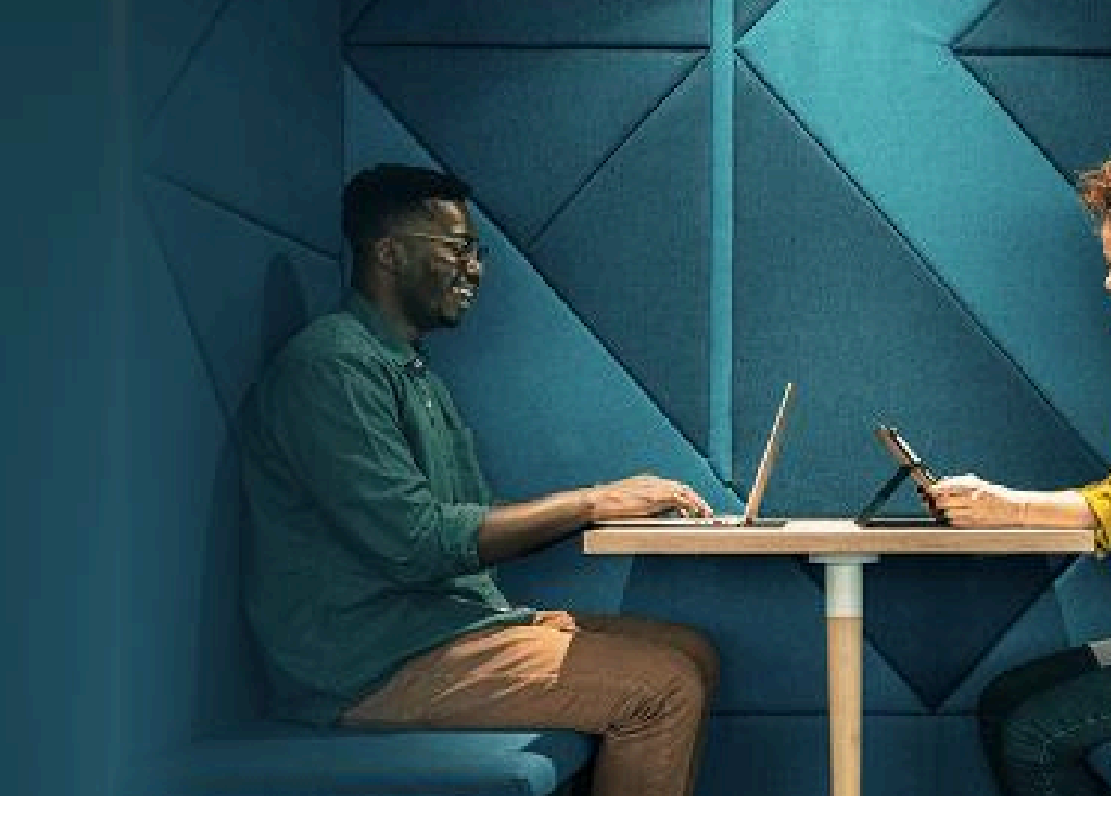
Table customisation



When an action bar is used with the Expanded or Advance table we can add the ability to customise the table. This allows users to customise what columns are shown or hidden and change which order they display.

Dialog

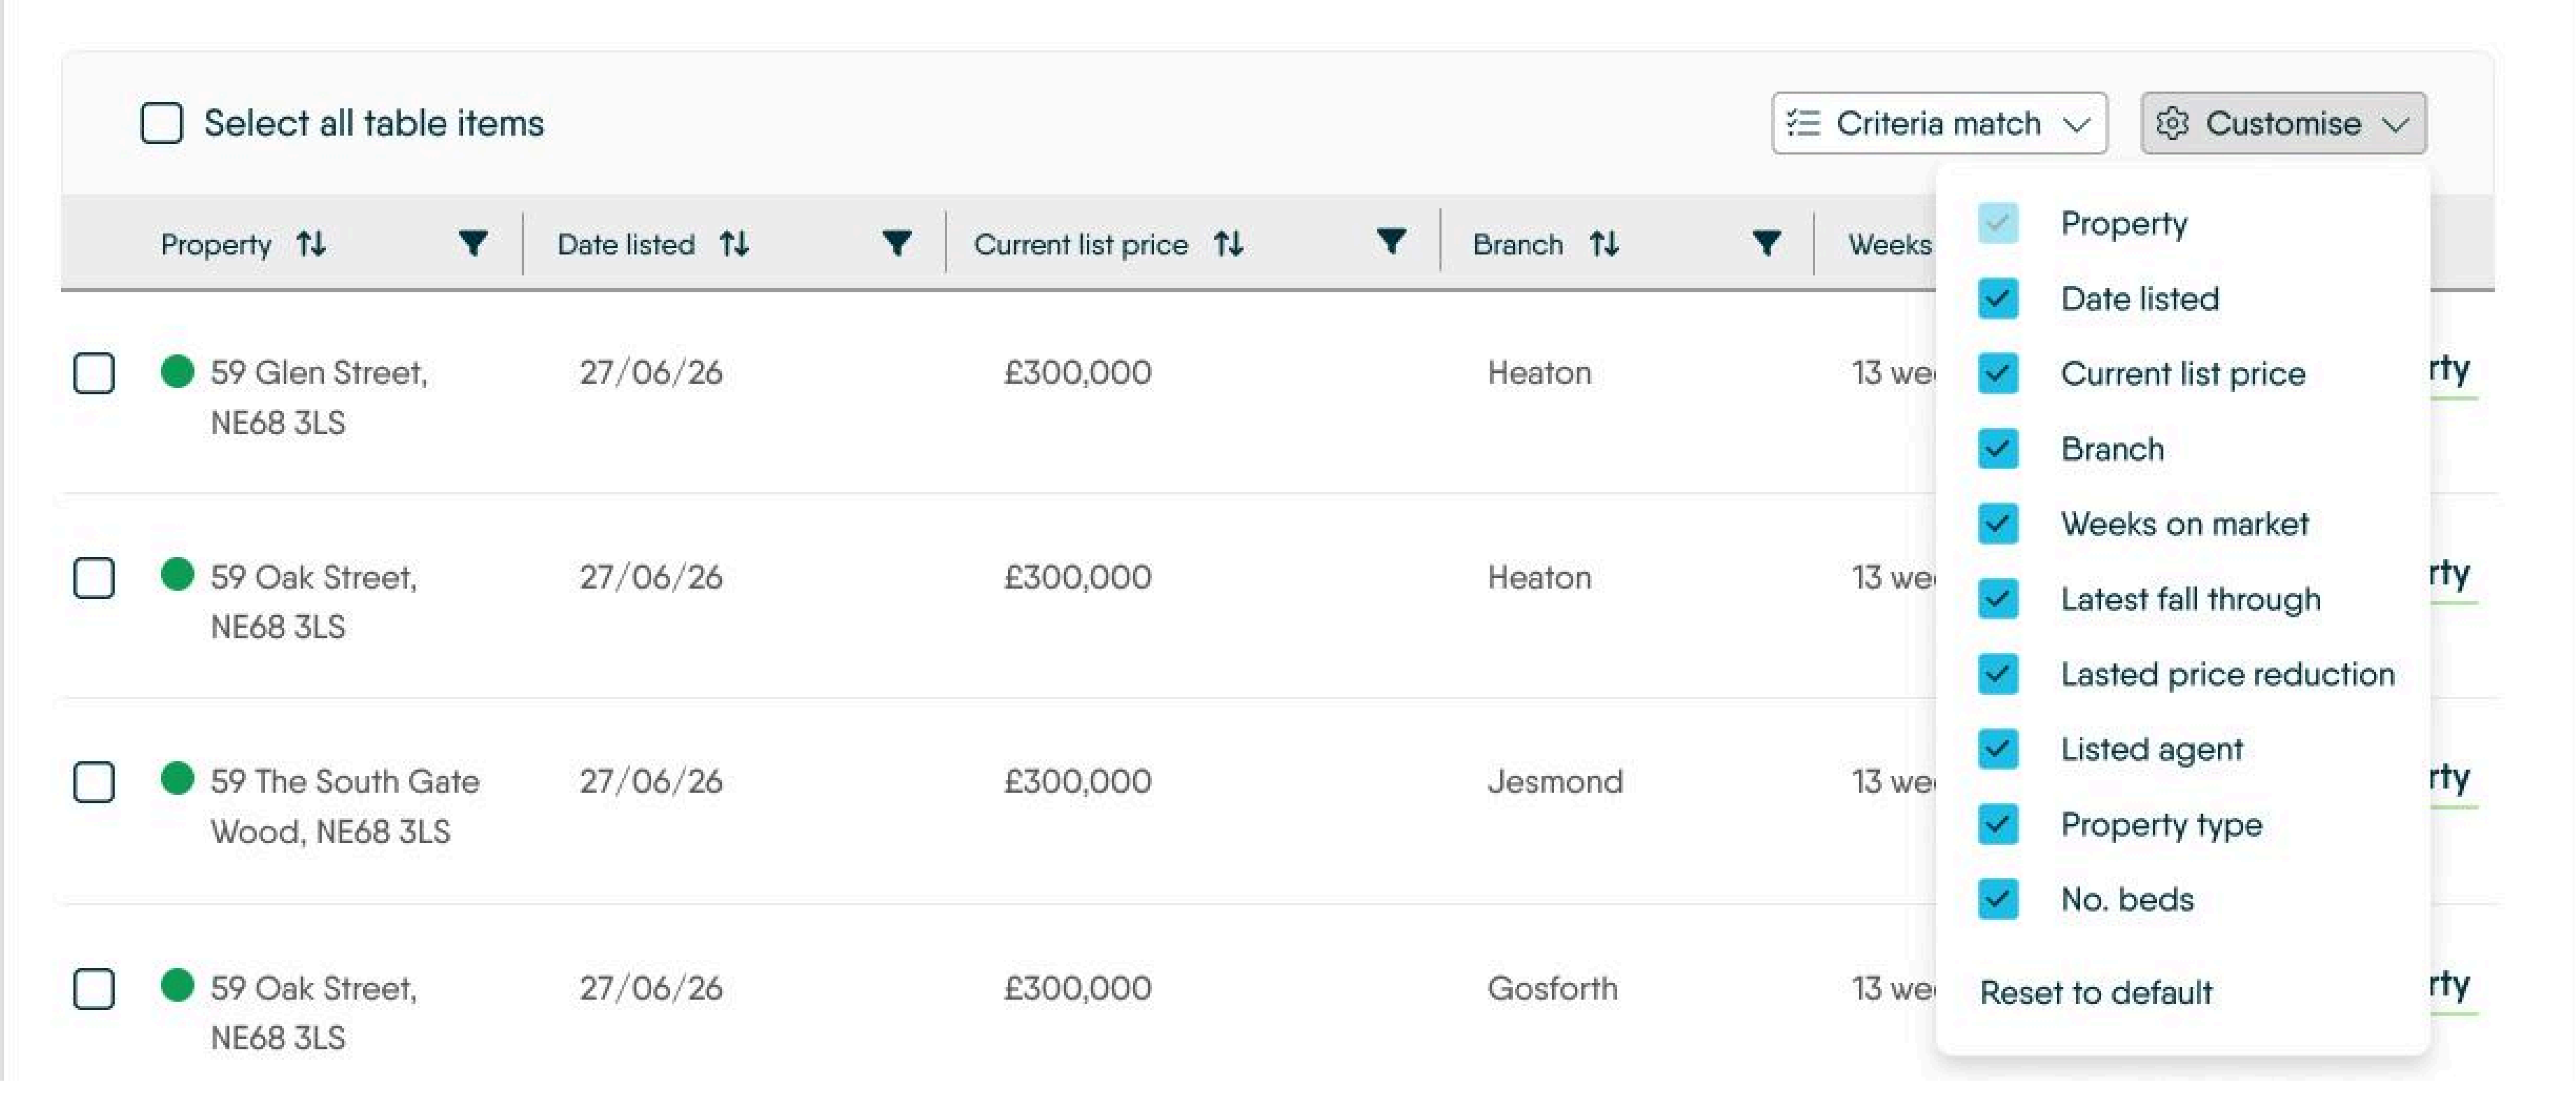
Column show/hide

When an action bar is used with a table we can add the ability to show and/or hide via the ‘Customise’ button.

Clicking the ‘Customise’ button displays a dialog that allows users to show/hide columns by checking or unchecking the checkbox adjacent to the column name. This change can occur immediately or upon save.

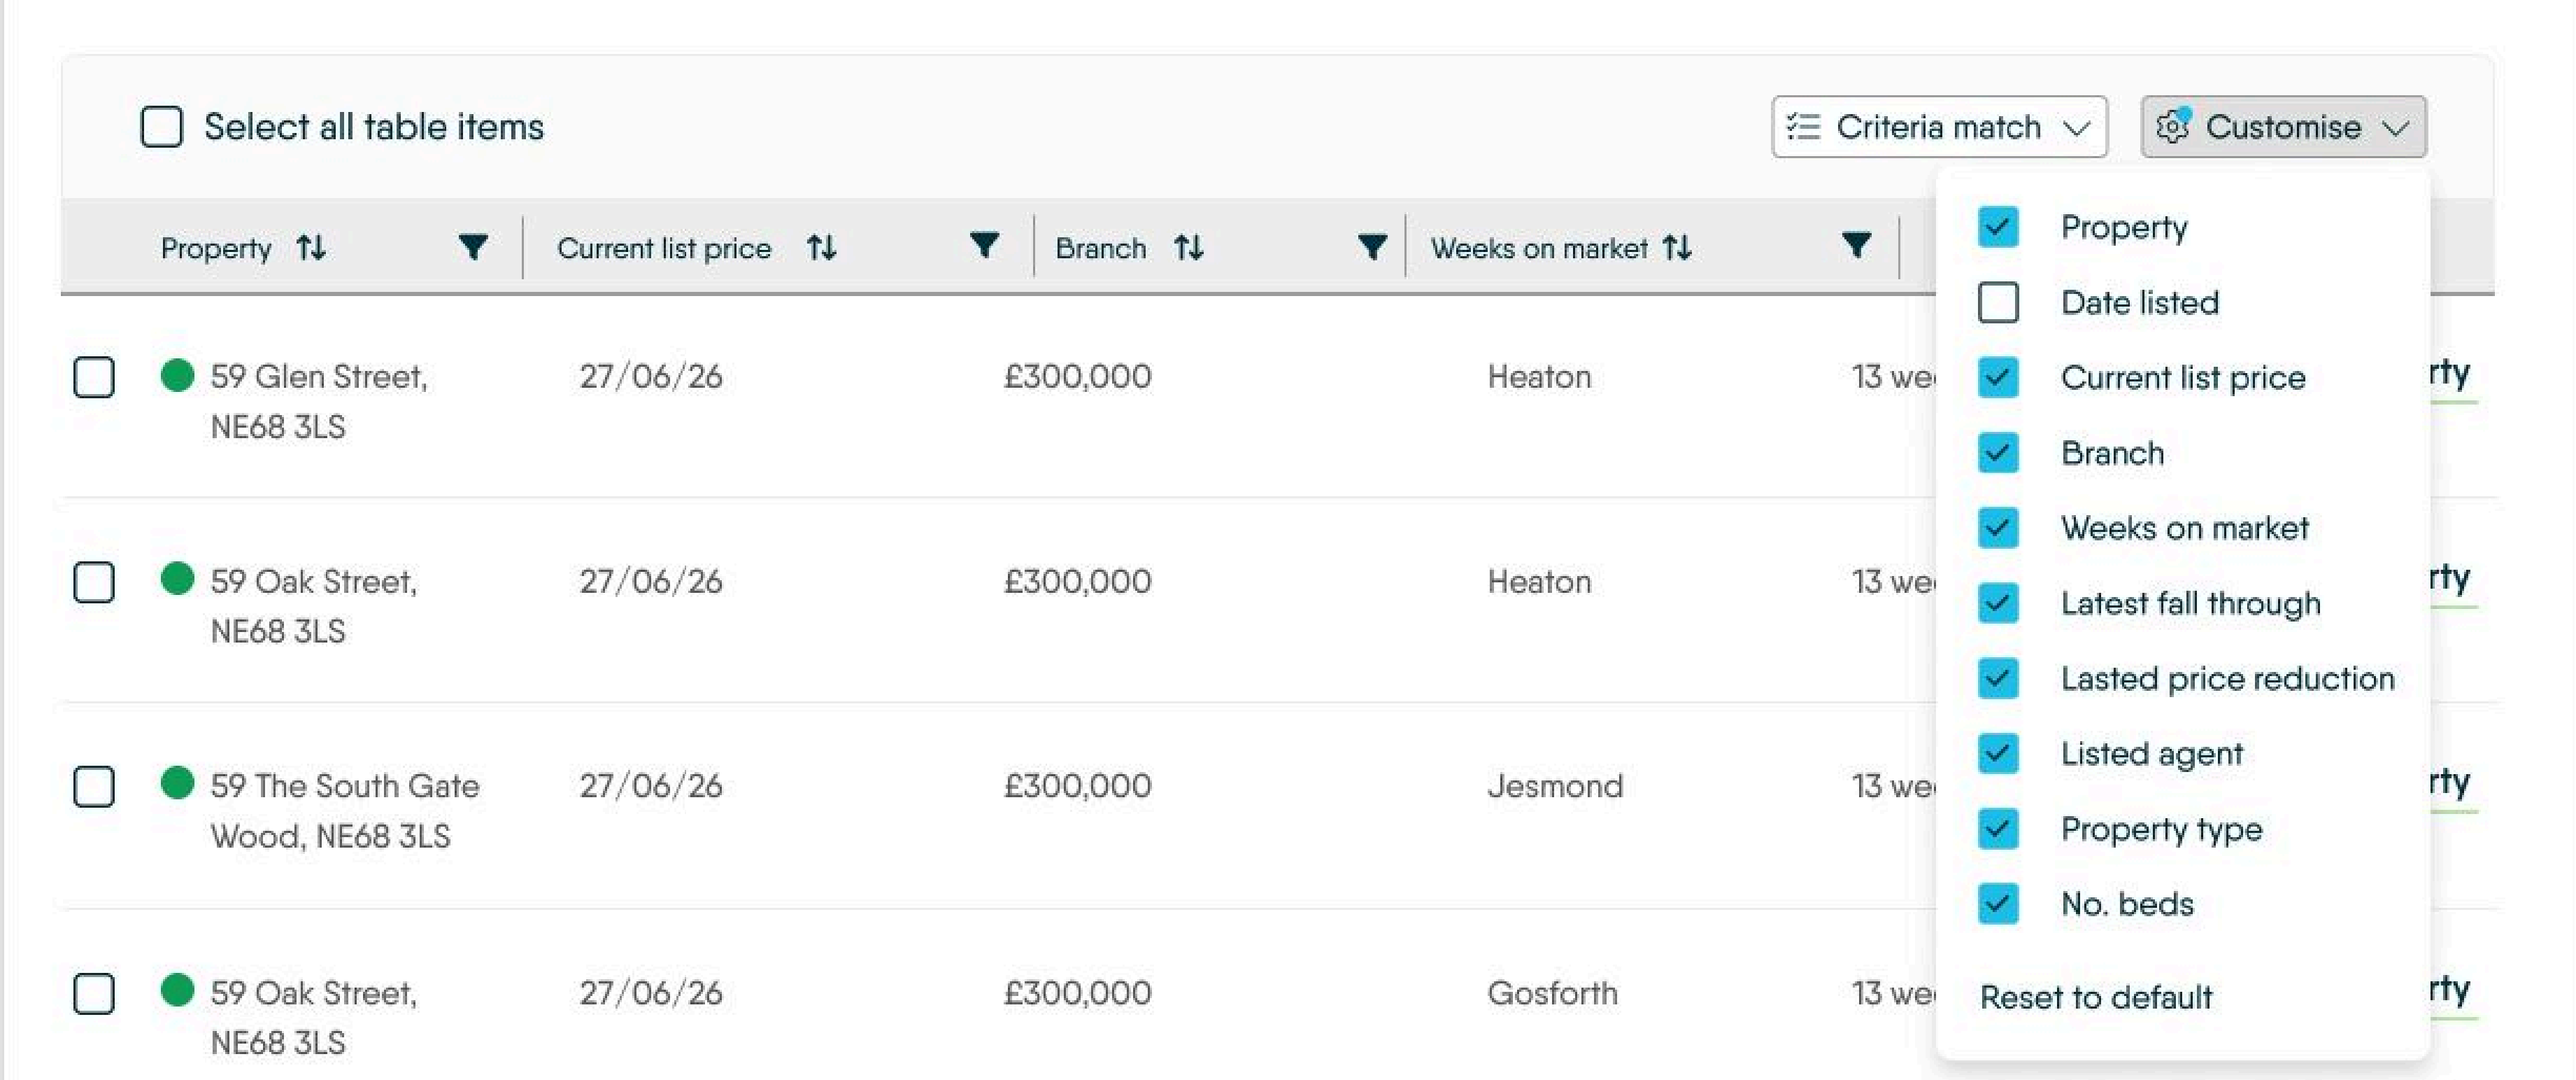
An ajax call can be used to receive the new columns if desired.

Show/hide on change



Each column in the table has a checkbox adjacent to it. Un-checked columns will be hidden from the table.

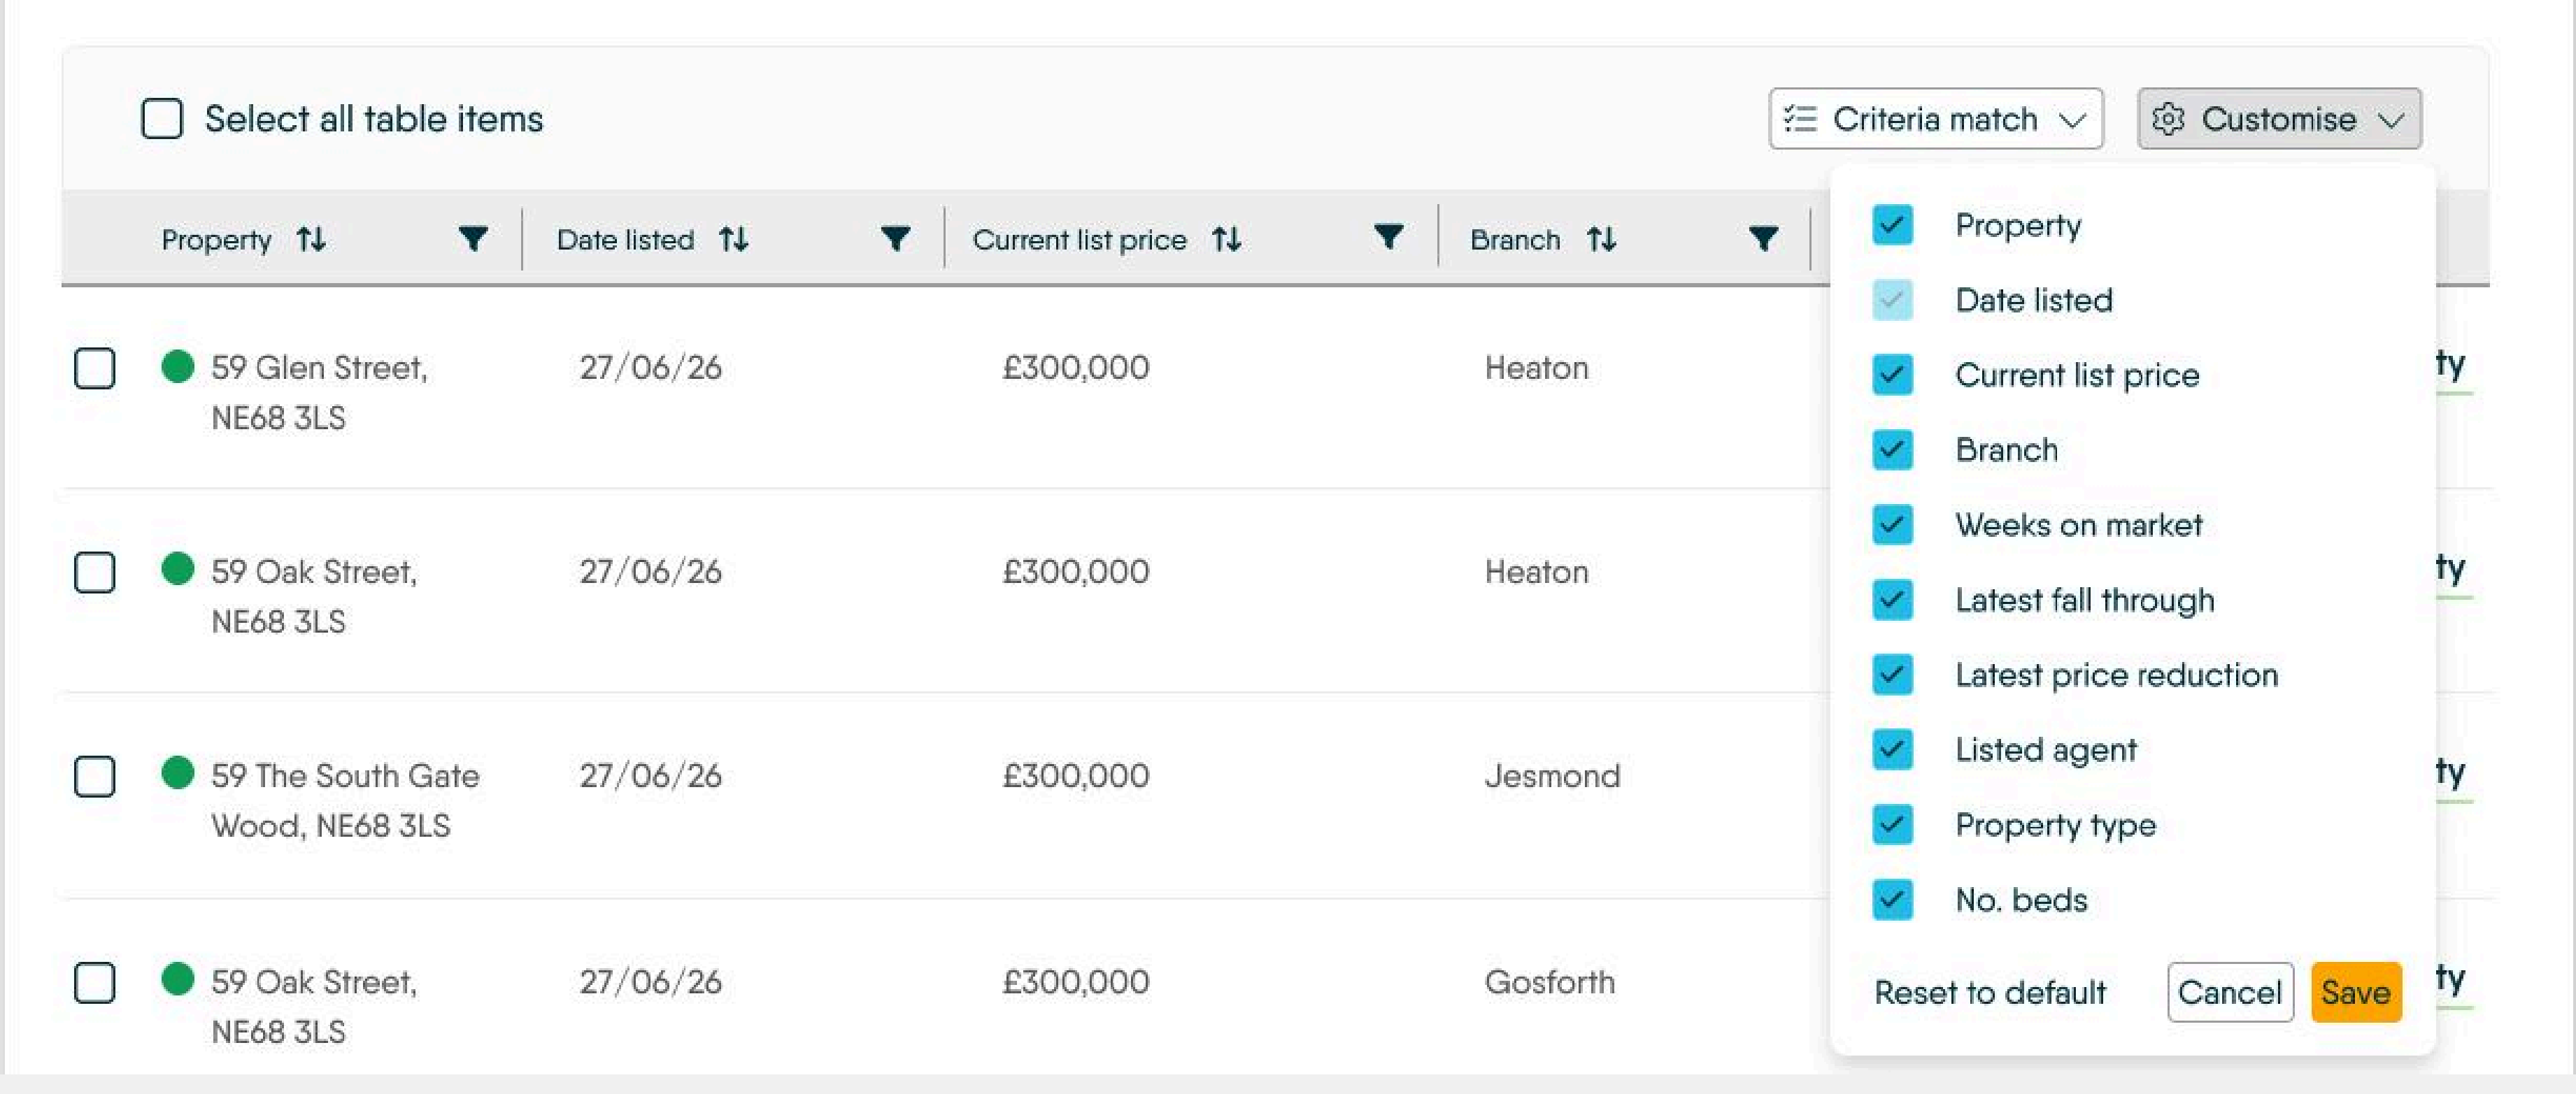
Checkboxes that are in the disabled state are columns that can’t be hidden



If the user clicks ‘Reset to default’ then the menu should return to the default values specified by the system.

A blue dot appears on the edit table button to show the user that the table has been configured and saved so the user is aware changes have been applied when visiting it later.

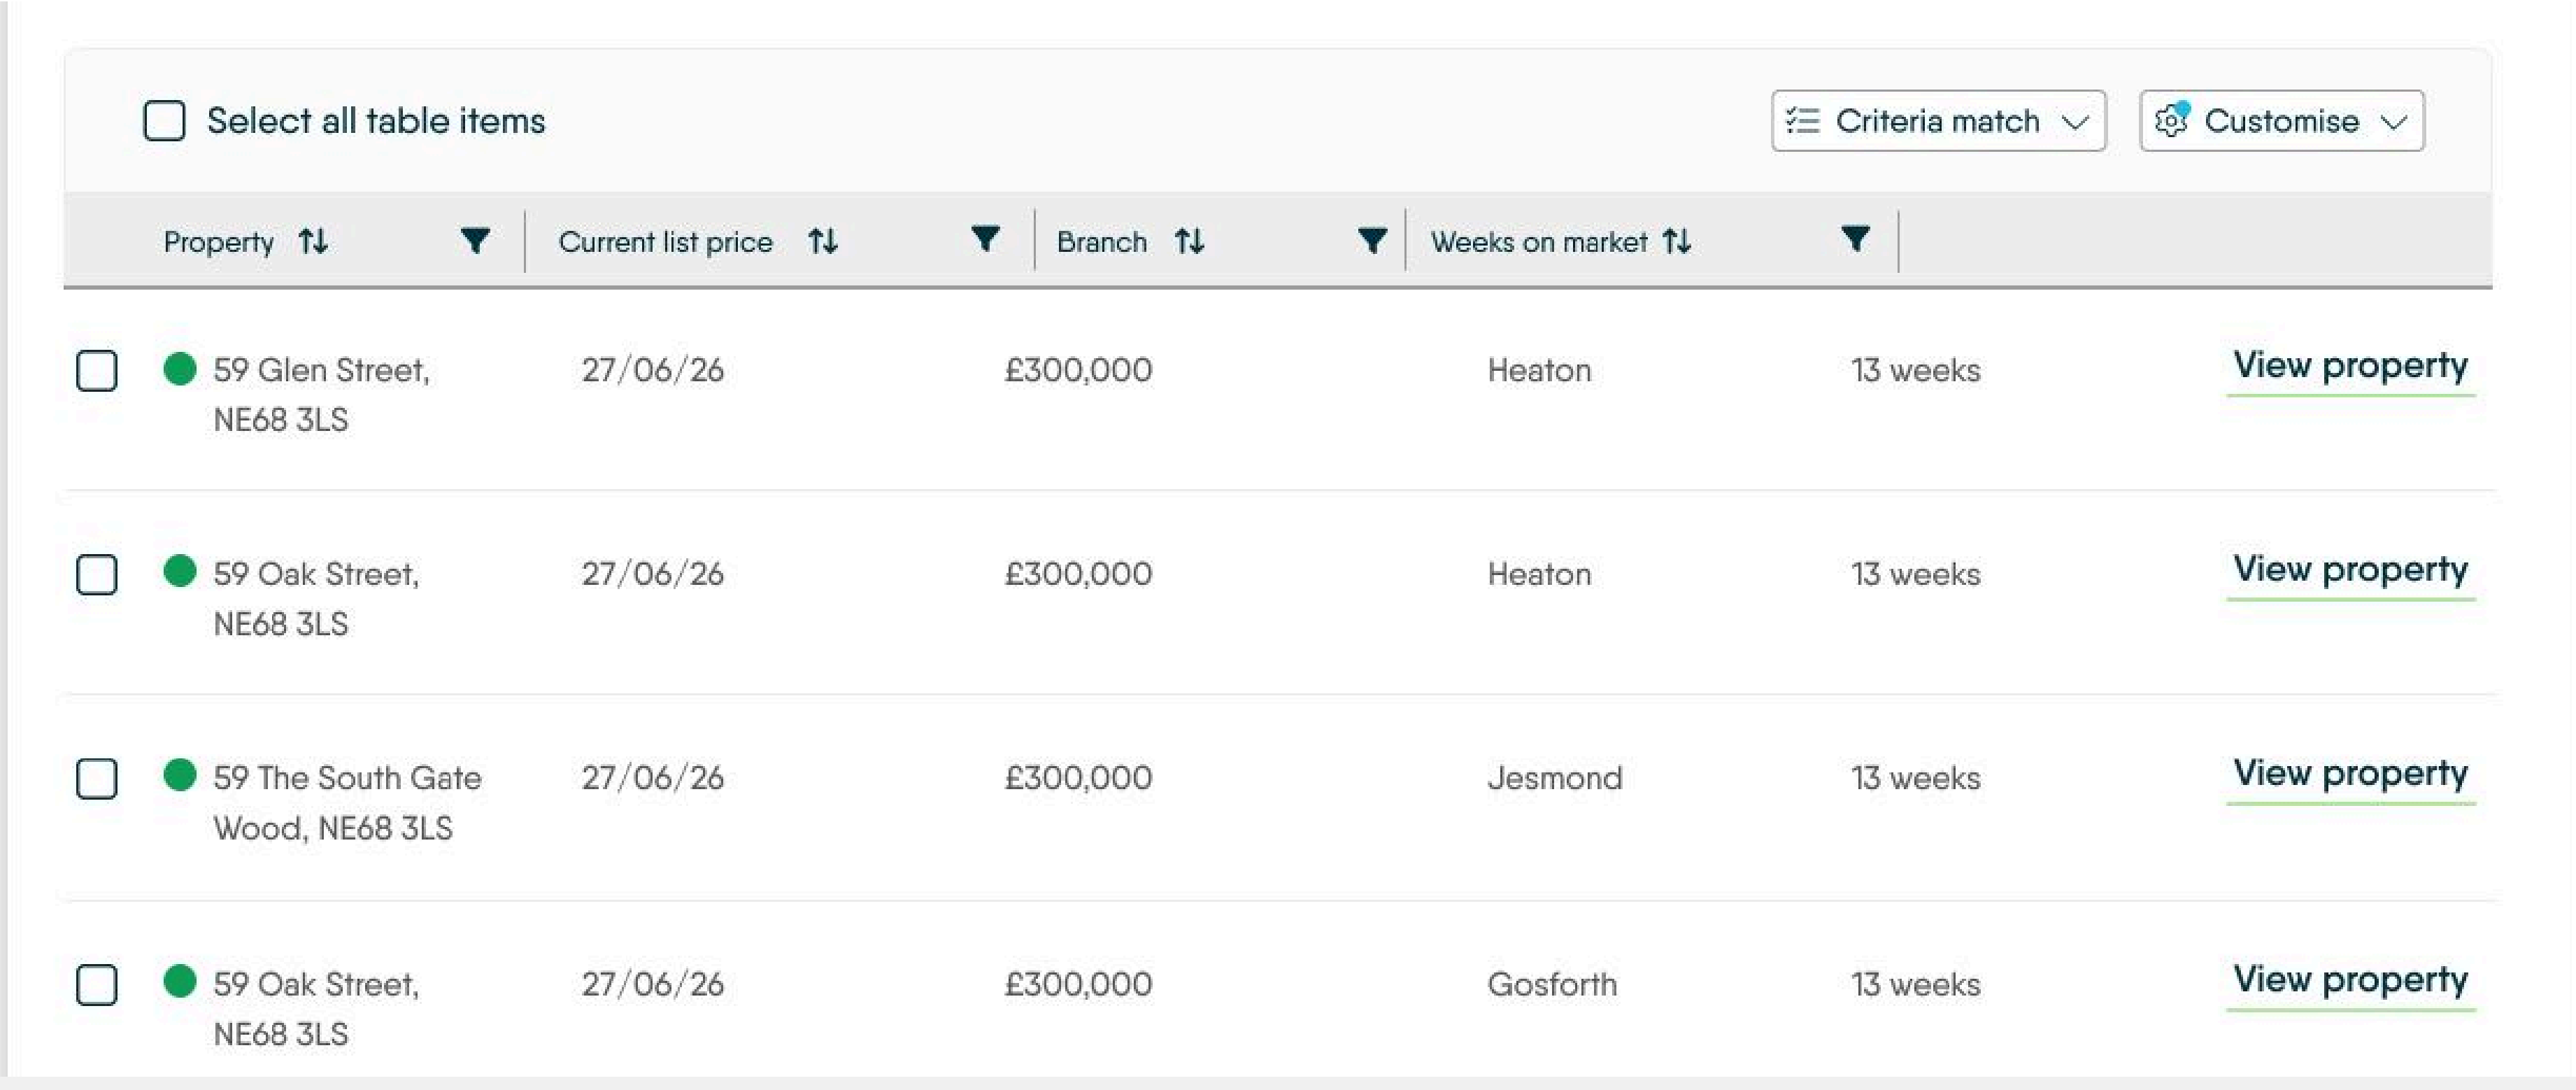
Table customise on save



Each column in the table has a checkbox adjacent to it. Un-checked columns will be hidden from the table on save and a success toast notification will be displayed to give the user confirmation that the save has occurred.

Checkboxes that are in the disabled state are columns that can’t be hidden.

If the user clicks ‘Reset to default’ then the menu should return to the default values specified by the system.



When the user clicks save it hides the column. A ‘saved’ customised state can only be cleared if the user ‘resets’ table, supersedes a save or clears cookies.

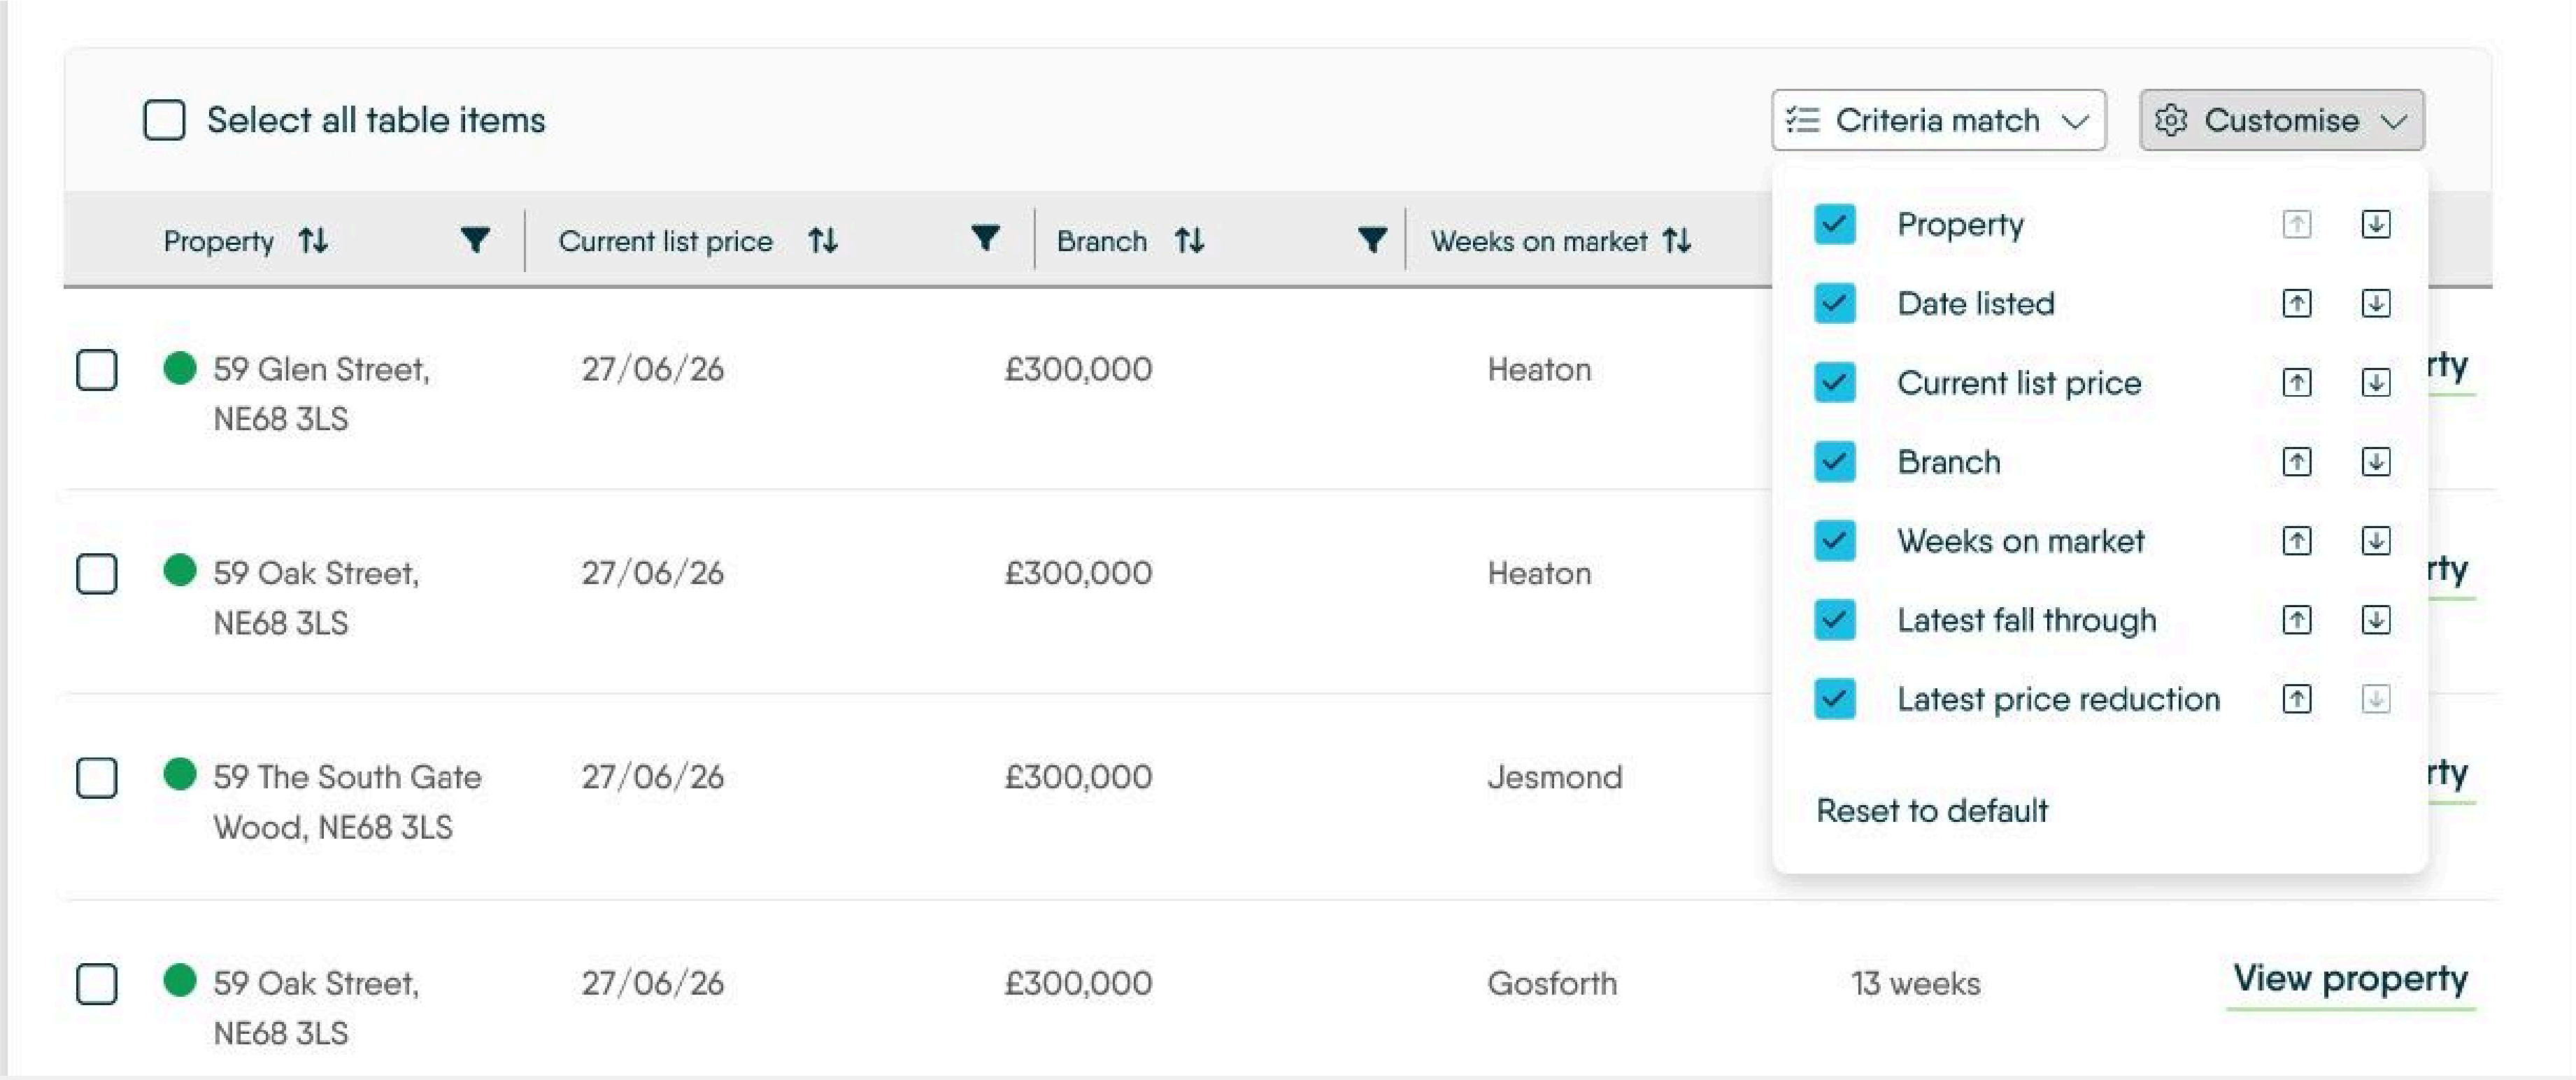
A blue dot appears on the edit table button to show the user that the table has been configured and saved so the user is aware changes have been applied when visiting it later.

Re-ordering columns

When an action bar is used with a table we can add the ability to re-order columns via the ‘Customise’ button.

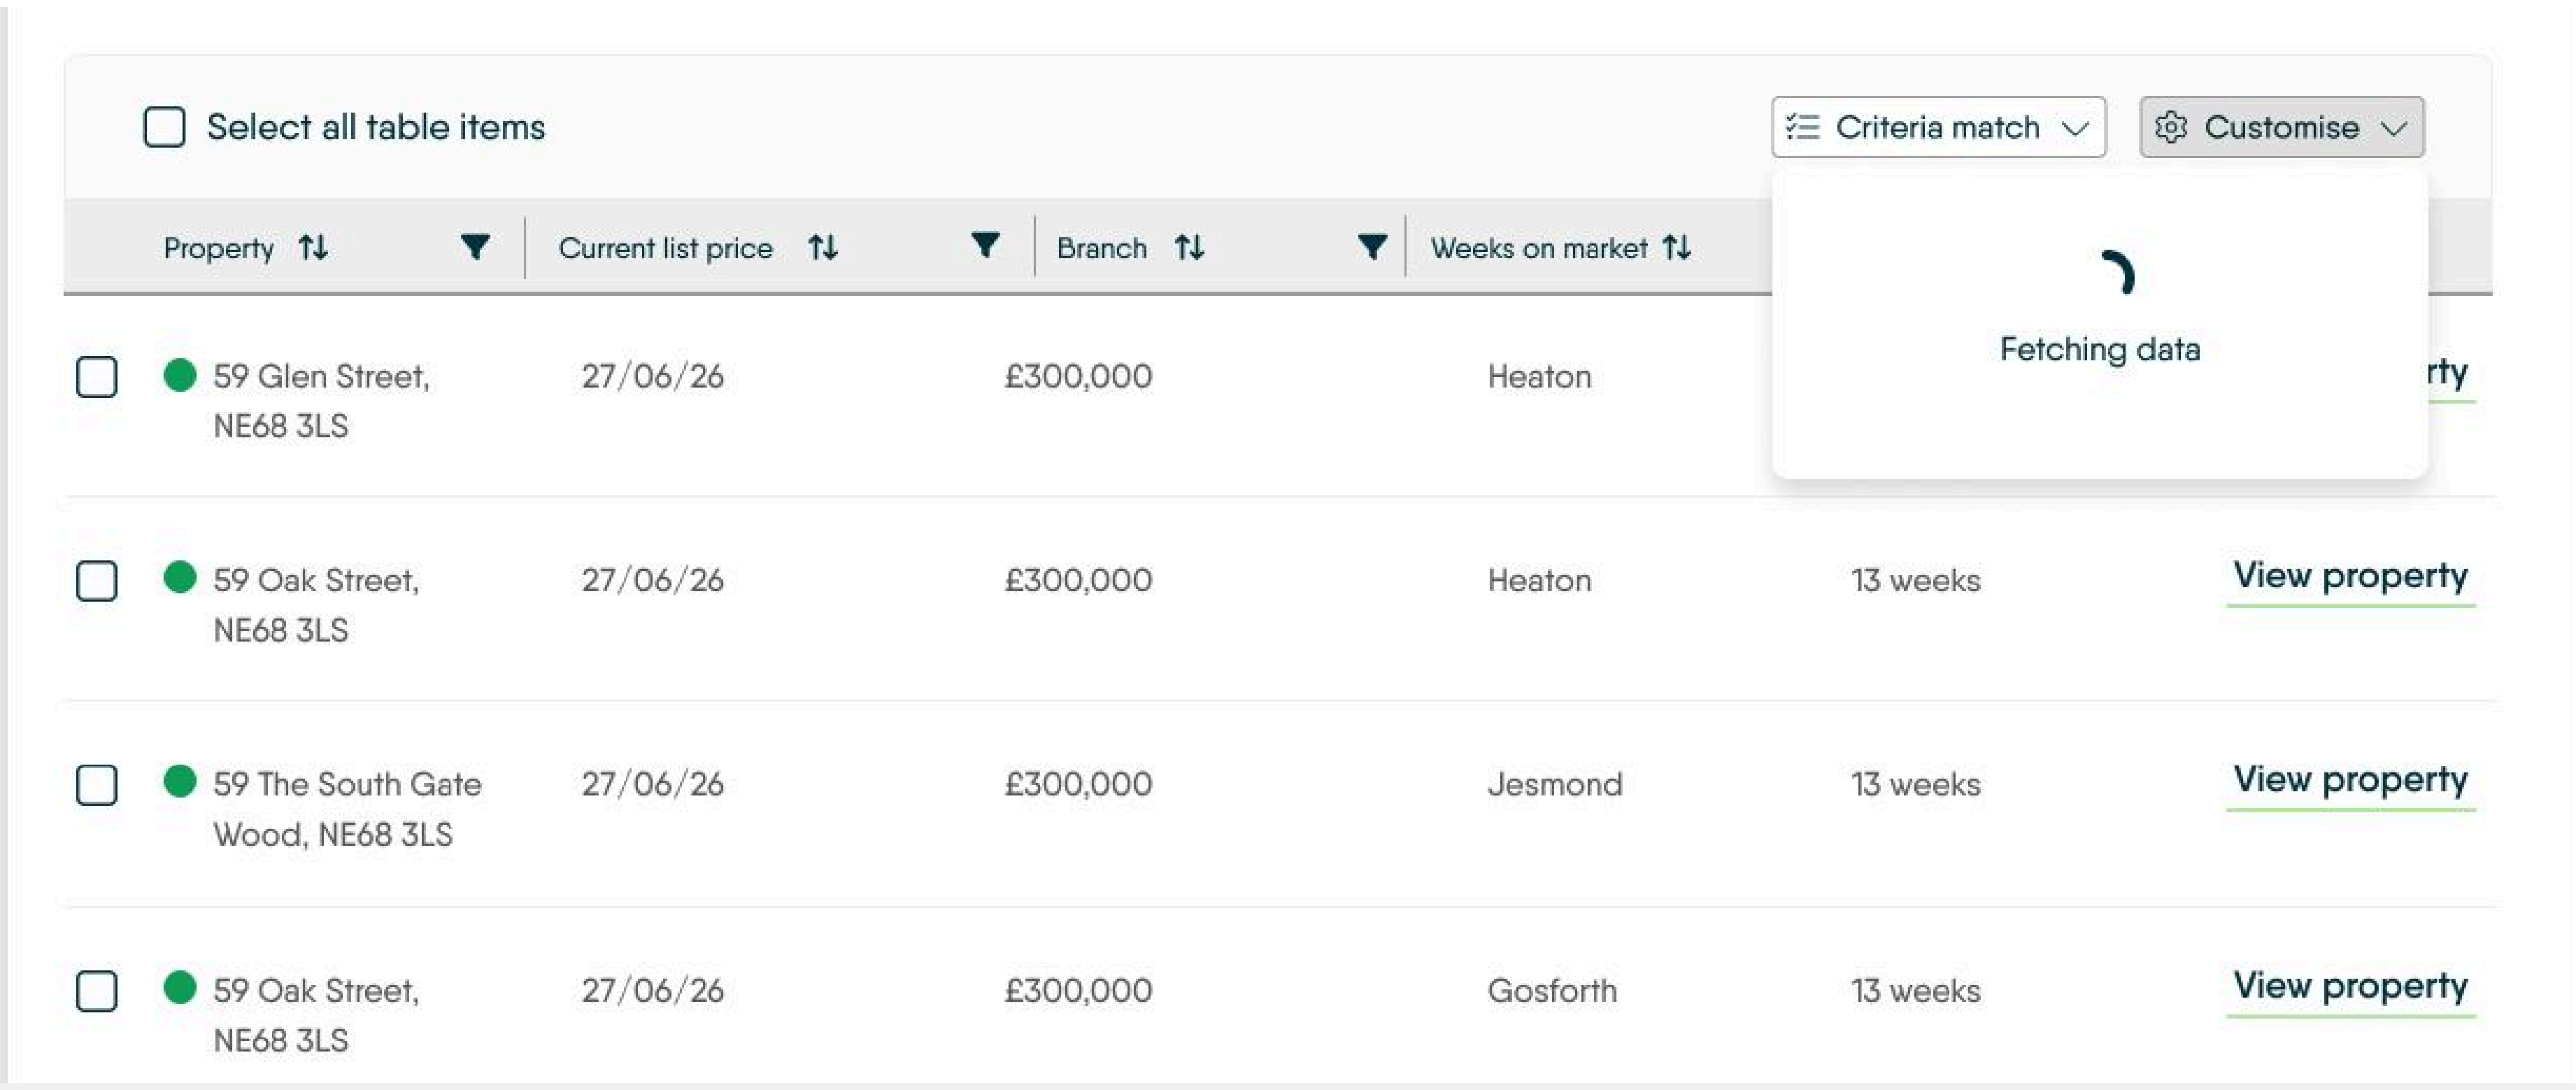
Clicking the ‘Customise’ button displays a dialog that allows users to arrow buttons to move the column up or down the list. This change can occur immediately or upon save.

An ajax call can be used to receive the new column order if desired.



Loading state example

In the event of the table customisation taking more the 3 secs a ‘fetching data’ loading state with animated spinner will display to provide feedback to the user that the action is taking place, it’s just taking longer than expected.



Version control:	Date of design update:	Notable updates:
V1 added	24.08.2026	The table customisation options have been created to give further customisation functionality to the user when used the action bar is use in conjunction with expanded/advanced tables.
